

Salient cultivar features of

### EdibleNut:

- No phorbol esters
- Favourable fatty acid composition
- Favourable amino acid composition
- Concentrated harvest period
- Reduced plant size for easy harvest
- Adapted to diverse environments
- High yield stability

Chuta: own data; other nuts: USDA National Nutrient Data Base 2017

Cultivars completely lacking phorbol esters provide the basis for **EdibleNut**, from which the innovative nut known as **Chuta®** can be grown. Delicious snacks and other foodstuffs can be produced from **Chuta®** kernels. Another possibility is the extraction of oil that can be used for cooking or as a raw material for cosmetics. The remaining press cake or kernel meal can be channeled into production of protein powder.

GREEN IS NOT ENOUGH
